

Making long-stay booking easier on Airbnb

For remote workers relocating
for 1–6 months

Proposed concept: Long-stay brief

Independent product case study. Not affiliated with Airbnb.

Longer stays make everyday fit matter more

Public research offers a demand signal, not a count of Airbnb relocation customers

Weeks per stop

26%

reported financial stress

25%

reported personal safety concerns

MBO Partners, 2025. U.S. digital nomads. Self-reported survey findings.

Independent product case study. Not affiliated with Airbnb.

The first customer has a fixed workday and an unfamiliar city

Proposed segment: solo workers or couples, domestic relocation, entire homes, 28–90 nights

Journey	Guest uncertainty · hypothesis	Host tension · hypothesis
Shortlist	Can I work here every day?	Repeated amenity questions
Compare	What will I pay, and when?	Discounts versus calendar value
Commit	What if I need to leave early?	Late cancellation blocks income
Arrive	Does the home match the promise?	Disputes and costly recovery

Discovery proposal

12 guest decision replays + 8 host interviews + 6 booking-task tests

Airbnb already has much of the foundation

Public experience review: the opportunity is to connect information at the decision point

Airbnb editorial image · April 2025

Existing foundation

Monthly amenity highlights and wifi tests
Fee-inclusive search totals before taxes¹
Monthly payments and long-stay policies

Proposed improvement

One decision view with dated work evidence, charge timing and cancellation exposure.

¹ Tax display varies. Domestic monthly stays in India require full payment at confirmation.

The opportunity depends on qualified demand and enough suitable homes

Illustrative sizing model. Every input below is an assumption, not Airbnb data

100,000

eligible searchers / quarter

+0.5 pp

absolute booking lift
5.0% to 5.5%

500

incremental bookings
before stay-quality
checks

Illustrative sensitivity

Absolute lift	+0.2 pp	+0.5 pp	+1.0 pp
Extra bookings	200	500	1,000

A Long-stay brief before the guest commits

Proposed interface concept. All property details, prices and dates are illustrative

Long-stay brief

Oct 1–Nov 30, 2026 · Entire home · 60 nights

Work setup

Desk + chair Host photos and dimensions

Wifi: 85 Mbps Download · tested Sep 8

Noise Street noise · host declared

Utilities Host confirms inclusions / caps

Test results vary. View evidence and limitations.

US\$4,200 total

At booking US\$2,100

Oct 21 · next 30 nights US\$2,100

If your plans change

Choose a date to see refund + amount owed

Collected taxes and fees included. Required agreements and disclosed extras appear before booking.

The MVP improves decisions without rewriting host cancellation terms

Proposed prioritization: direct impact on the booking decision, bounded implementation risk

Decision	Scope	Why
Build first	Evidence fields + Long-stay brief	Makes suitability inspectable
Build first	Schedule + cancellation calculator	Clarifies financial exposure
Reuse	Search, messaging, policy engine	Keeps one source of truth
Defer	Inspection badge, free trial nights	Operational cost and host risk
Defer	Visa help and neighborhood scores	Legal complexity and bias risk

Host incentive hypothesis: fewer repeated questions and better-matched bookings

Trust needs evidence, limits and a remedy

Proposed operating model with guest and host protections

Claims guests can inspect

Timestamp evidence and flag unknowns.
Refresh stale claims, audit samples, allow host appeals.
A wifi test does not guarantee uptime.

Recovery with clear limits

Save the booked brief. Route serious mismatches to AirCover review. Rebooking depends on supply. Approve local rules before opening each market.

Proposed safeguard: no blanket “work-ready” badge

Success means more bookings that become successful stays

Proposed experiment: persistent 50/50 guest randomization within the same eligible host pool

Primary proposed metric

Successful day-7 stays per eligible searcher

Booked, checked in, still staying, and no unresolved material listing mismatch at day 7.

Proposed decision gates

Higher primary metric
95% confidence interval above zero

Host net earnings / available night
No decline beyond 2%

Support cost / eligible searcher
No increase beyond 5%

Diagnostics: booking rate, decision time, comprehension, evidence coverage, dispute rate

Scale only when guests and hosts both benefit

Proposed rollout with explicit evidence gates

01

Discover

Decision replays and task tests

Gate: the brief resolves material uncertainty

02

Pilot

28–90 nights
Two domestic markets

Gate: quality lift with host and cost guardrails

03

Expand

91–180 nights
Then new markets

Gate: completed-stay health and local approval

Product hypothesis: clearer commitments create better matches
