

# Healthy automation can look like disengagement

- |    |                     |                                                                                                |
|----|---------------------|------------------------------------------------------------------------------------------------|
| 01 | BRIEF ESTABLISHES   | Fragmented signals make prioritization difficult.                                              |
| 02 | RESEARCH SUPPORTS   | Activity can misrepresent adoption.<br>LodgIQ prevalence is unknown.                           |
| 03 | HYPOTHESIS TO TEST  | Completed pricing work identifies cases where intervention helps.                              |
| 04 | DISCOVERY MUST SHOW | Frequency, consequences and current handling.<br>Compare workflow, trust and support problems. |

## Proposed RMS dashboard: fund discovery before the build.

Week 2 deliverables: a validated problem map, a chosen baseline, an event audit, and a go / no-go MVP specification. Evidence to date: case brief, S1 and S4. No interviews or internal measurements obtained.

# A green workflow label cannot clear a relationship concern

|                                                                                                         |                                                                                                    |                                                                                                               |                                                                                                           |
|---------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------|
| <div><div></div> <b>Healthy</b></div> <div>Monitored pricing work completed. No detected problem.</div> | <div><div></div> <b>Needs attention</b></div> <div>One or more assessed checks below target.</div> | <div><div></div> <b>At risk</b></div> <div>A check has breached, or a critical input is verified stale.</div> | <div><div></div> <b>Not assessed</b></div> <div>Evidence missing or stale, so no status is claimed.</div> |
|---------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------|

| DIMENSION                  | WHAT IT TELLS LEADERSHIP                                                                |
|----------------------------|-----------------------------------------------------------------------------------------|
| RMS workflow health        | Is expected pricing work happening successfully?                                        |
| Evidence confidence        | Can reliable information support the assessment?                                        |
| Reported customer concerns | Dissatisfaction, lost trust or relationship issues, kept separate from workflow health. |

| <div><div></div> <b>ROLE AND THE DECISION IT MAKES</b></div>                 |
|------------------------------------------------------------------------------|
| <b>Operations:</b> which properties get worked today, in what order.         |
| <b>Revenue:</b> whether a pattern is a pricing problem or a product problem. |
| <b>Sales:</b> whether an account needs a relationship intervention.          |

| <div><div></div> <b>SCOPE IN V1</b></div>                                         |
|-----------------------------------------------------------------------------------|
| Customer concerns are logged manually with source and date. CRM sync is deferred. |
| Account = commercial relationship. Property = scoring unit.                       |

# Completion needs reliable records and pricing inputs

| SIGNAL, LAST 14 DAYS             | NEEDS ATTENTION   | AT RISK          |
|----------------------------------|-------------------|------------------|
| Pricing cycles completed         | 60 to under 85%   | Under 60%        |
| Rate pushes acknowledged         | 80 to under 95%   | Under 80%        |
| Completion drop vs prior 14 days | 20 points or more | Never on its own |

**Considered and cut from V1:** feature breadth, AI usage, seat-level engagement. All three measure activity, and activity is the thing that misrepresents adoption.

SCORING RULE

Intentional no-change counts as completed work.

**Healthy requires all assessed checks to pass.**

Override changes need context. Reported trust concerns stay separate.

EVIDENCE HANDLING

Activity records missing or stale: **Not assessed.**

Critical pricing input verified stale: **At Risk.**

Essential input evidence unavailable: **Not assessed.**

# The book first, then the queue that works it

|                        |                             |                                    |                            |                                |
|------------------------|-----------------------------|------------------------------------|----------------------------|--------------------------------|
| BOOK<br>300 PROPERTIES | 214<br><div>● Healthy</div> | 52<br><div>● Needs attention</div> | 26<br><div>● At risk</div> | 8<br><div>● Not assessed</div> |
|------------------------|-----------------------------|------------------------------------|----------------------------|--------------------------------|

Interventions (3)

⚠ Lead A: 4 open cases / capacity 3

| PROPERTY / RMS              | MAIN REASON                       | OWNER      | ACTION DUE    | ISSUE AGE |
|-----------------------------|-----------------------------------|------------|---------------|-----------|
| Lakeside <div>AT RISK</div> | Six missed reviews                | Lead A     | 1 day overdue | 5 days    |
| Marina <div>AT RISK</div>   | 10 of 20 rate pushes acknowledged | Unassigned | Today         | 2 hours   |
| Harbour <div>HEALTHY</div>  | Customer disputes pricing logic   | Lead A     | Tomorrow      | 1 day     |

**Harbour, healthy workflow:** 13 of 14 cycles completed, inputs current. The dispute sits against the account, not the workflow score. Next: check strategy, inputs and explanation.

**Data checks (1):** Orchid, not assessed. Evidence 72 hours old. Owner: Data. No status is claimed until the feed is verified.

# The dashboard must beat the simplest feasible option

| OPTION, 30 PROPERTIES, TWO REVIEWS PER WEEK | MIN / REVIEW | REVIEW H | FOLLOW -UP H | UPKEEP H | TOTAL H |
|---------------------------------------------|--------------|----------|--------------|----------|---------|
| Reports and tracker                         | 8            | 8        | 3            | 1        | 12      |
| Consolidated view                           | 6            | 6        | 3            | 1        | 10      |
| Intervention dashboard                      | 4            | 4        | 3            | 2        | 9       |

Review h = 30 × 2 × min/review ÷ 60. Follow -up = 6 issues × 0.5 h = 3 h. Illustrative; all times require measurement.

SIX CAPABILITIES, RANKED

- 01

Mapping and access — property to account, role-based views.
- 02

Evidence and feed checks — records present, current, trustworthy.
- 03

Rules and reasons — status from stated thresholds, reason shown.
- 04

Queue and detail — ranked work list, drill-down to the evidence.
- 05

Actions and concerns — assign an owner, log a concern with source.
- 06

Review and recovery — what was done, and whether it recovered.

Not in V1: cross-product scoring, churn prediction, CRM sync.

**Pilot:** five matched account pairs, dashboard versus selected baseline, run concurrently. Measured: review time, interventions raised, share correctly prioritized, recovery rate and time.

# People resolve concerns. AI summarizes the evidence

## RULES

Calculate workflow health and select playbooks.

## COMPARISONS

Describe changes without inferring intent.

## AUTOMATION

Deduplicate cases and send internal reminders.

## AI TRIAL

Summarize property issues and reported concerns.  
Preserve attribution and dates.

**Gate: 30% faster correct reviews, with no unsupported claims and no omitted material concerns.**

The template remains available. People approve outreach, escalation and resolution.

# Fund 280 h now. 716 h releases on evidence.

|                                                                              |                                                                              |                                                                                                                                                    |
|------------------------------------------------------------------------------|------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| <div>16 h / week</div> <div>saved at 300 properties, from 94 h to 78 h</div> | <div>62 weeks</div> <div>payback on hours alone, against a 996 h build</div> | <div>31 h / week</div> <div>roughly what efficiency alone would have to save to clear a 32-week gate, which no plausible time saving reaches</div> |
|------------------------------------------------------------------------------|------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|

THE GATE IS DENOMINATED IN RECOVERY

The pilot measures prevented escalations and recovery time.  
The remaining **716 h** releases only if that evidence clears the bar.  
**Efficiency is the floor, not the case.**

DEPENDS ON

Reliable event records with property to account mapping. A logged source for customer concerns. Named owners with follow-up capacity.  
**If any of these fail, scoring stops rather than shows green.**

|                                                      |                                                       |                                                       |                                                        |
|------------------------------------------------------|-------------------------------------------------------|-------------------------------------------------------|--------------------------------------------------------|
| <div>WEEKS 1-2</div> <div>Validate and specify</div> | <div>WEEKS 3-4</div> <div>Build five properties</div> | <div>WEEKS 5-6</div> <div>Matched account pilot</div> | <div>WEEKS 7-8</div> <div>Expand, revise or stop</div> |
|------------------------------------------------------|-------------------------------------------------------|-------------------------------------------------------|--------------------------------------------------------|

# Operating model, and what each function must supply

## WEEKLY EFFORT AT 300 PROPERTIES, HOURS

| OPTION                 | REVIEWS | FOLLOW - UP | UPKEEP | TOTAL |
|------------------------|---------|-------------|--------|-------|
| Consolidated view      | 60      | 30          | 4      | 94    |
| Intervention dashboard | 40      | 30          | 8      | 78    |

Reviews =  $300 \times 2 \times \text{min/review} \div 60$ , at 6 min and 4 min. Follow-up =  $60 \text{ issues} \times 0.5 \text{ h} = 30 \text{ h}$ .  
Saving =  $94 - 78 = 16 \text{ h}$  per week. Payback =  $996 \div 16 = 62.25 \text{ weeks}$ .

## FUNCTION COMMITMENTS, 996 H TOTAL

| FUNCTION    | MUST SUPPLY                                                        | BY           | HOURS |
|-------------|--------------------------------------------------------------------|--------------|-------|
| Data        | Event audit, property to account mapping, feed freshness checks    | Week 2       | 100   |
| Product     | Validated problem map, chosen baseline, MVP specification          | Week 2       | 160   |
| Design      | Queue, drill-down and concern logging                              | Week 3       | 64    |
| Engineering | Rules engine, queue build across five properties, then pilot scale | Weeks 4 to 8 | 640   |
| Review      | Evidence checks and AI summary verification on 50 cases            | Weeks 5 to 8 | 32    |

## WHY THE BASELINE IS CONSERVATIVE

Follow-up volume is held constant at 60 issues per week in both options, so the model credits the dashboard with faster reviews only.

The pilot measures whether prioritization changes the number, quality and recovery rate of interventions. A stronger case has to come from that evidence, not from the assumption.
